

WHO WE ARE:

[Citizens for Responsible Energy Solutions](#) is a 501(c)(4) non-profit organization advocating for comprehensive and responsible solutions to our nation's energy issues. We are citizens from around the country who believe it is time for politicians in Washington to stop arguing, and start working on ways to solve our nation's energy crisis.

OUR PRINCIPLES:

Our work is based on the common values we all share – basic good stewardship, the importance of clean water and air, and a sustainable energy plan that reduces our dependence on hostile nations, secures our energy sources for the future and creates jobs.

America can lead the world in developing comprehensive and responsible energy solutions that can reduce pollution, improve public health, secure our energy future and grow our economy. Private and public investment into new technologies can have tremendous benefit to our economy, environment, global competitiveness and ultimately, national security and energy independence. As Americans we know our country works best when we work together. It is time to start working together for a better future that is based on our common values:

- It is time for America to become the leader in innovative, new energy technologies.
- Energy policy has become an unnecessarily politicized issue. It's time for elected officials on both sides of the aisle to stop arguing and work together for a better future.
- Common sense energy solutions have a role to play in lowering gas prices, creating jobs and stabilizing our economy.
- Private enterprise drives innovation and public investment in new technologies drives our economy.
- America should scale back dependence on oil from hostile nations and keep more of our tax dollars at home.
- Acting as responsible stewards of God's creation ensures a legacy of a clean and safe environment for future generations.

PUBLIC AND PRIVATE SOLUTIONS:

While our business and political leaders have made some progress, it has not been enough to secure America's energy future. There are opportunities that can provide large pay-offs for reasonable investments. As private citizens, we can do what we can to be responsible stewards of the environment. Private enterprise should take the lead on innovation and bringing new technologies to market. And, government can provide incentives to quicken the process, while adapting basic environmental regulations to protect public health while reducing burdens on innovation.
